#### DETAILED ACTION

### Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 49-82 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The scope of "acceptor centers" is confusing in view of applicant's response (Paper 7). Applicant's persuasion of argument relies on the relative position of "acceptor centers" in a base material to define a "contour."

Boron is clearly included as something that forms "acceptor centers" to define a contour in applicant's claimed invention. All Group III elements are also clearly included as elements that form "acceptor centers" in the claimed invention.

Yet, hydrogen-trapping centers of various kinds were known in the art before applicant's filing, which the examiner thought were also included in the scope of applicant's "acceptor centers" at the time of filing. For example, damage sites caused by Si implanted in Si was thought of as a way of creating "acceptor centers" when this case was initially examined.

Art Unit: 2829

While applicant clearly views "acceptor centers" as something particular that pulls in transported hydrogen, rather than <u>any</u> hydrogen-trapping site in general, the disclosure leaves "acceptor center" as an open-ended concept for "receiving transported hydrogen that was introduced spaced apart from the center."

Based on applicant's response (Paper 7), the "acceptor centers" of applicant's invention do not actually encompass all hydrogen-trapping sites known in the art.

While Group III elements are understood as suitable for making "acceptor centers" in silicon, the examiner is confused about a <u>clearly defined scope of applicant's</u> "acceptor centers".

Applicant repeatedly uses the term "acceptor center" in the disclosure, claims and prosecution, as if scope should be readily understood [1<sup>st</sup> appears at Summary of Invention]. Yet, the examiner had originally thought of applicant's "acceptor center" as including any site that can be considered as a hydrogen-trapping site.

Now, it seems, based on applicant's argument that there is no mention of "acceptor centers" in the hydrogen-trapping-sites disclosure of Henley et al., there must be a special definition of "acceptor centers" for applicant's claimed invention, which is unfortunately unclear from the claims and disclosure.

Is an "acceptor center" in the context of applicant's invention the same as a site that creates what is known as a "hole" (i.e. a positive charge carrier)? ... As in notoriously well known "donors" and "acceptors" that make n-type and p-type semiconductor regions?

Correction and/or explanation are required.

Art Unit: 2829

### Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

<u>Product-by-process</u> claims 49-82 are rejected under 35 U.S.C. 102(e) as being anticipated by structure disclosed in Goesele et al. (U.S. 5,877,070). See MPEP 2113.

The vast majority of limitations of pending claims 49-82 are "product-by-process" claims. The cancelled *process claims* have already been extensively examined in the parent case (09/476,456), and were allowed based on the way hydrogen is introduced to acceptor centers "spaced apart" before being transported to create a contour that can be expunged [see prosecution history and Reasons for Allowance in 09/476,456].

Per applicant (Paper 7), the pending product claims definitively include structural limitations that simply resolve into:

- A layer of material for use in connection with microcircuits;
- the layer having a surface contour defined by relative positions of a plurality of "acceptor centers"; and
- the layer is adapted for use in microelectronic circuits.

Page 4

Art Unit: 2829

For purposes of examination, a "contour" is a "shape" (per Applicant in Paper 7).

Therefore, the generally planar surface of a known SOI wafer is a "contour" because a generally planar surface is a kind of shape.

That is, a "contour" does not preclude a "generally planar surface" such as a generally flat surface of a notoriously well-known SOI (silicon-on-insulator) wafer.

Goesele et al. Discloses a generally planar layer of SOI material (i.e. that has a planar contour) expunged from a base substrate wherein the layer is adapted for use in connection with microelectronic microcircuits [i.e. the monocrystalline layer of silicon-on-insulator material per col. 1, lines 13-20 and lines 49-58] wherein a plurality of "acceptor centers" (i.e. boron implanted sites per col. 4, lines 10-20) defines a "contour" (i.e. the "contour" being a generally planar surface SOI wafer contour wherein the word "divides" of col. 1, line 17 is an expunging division along a generally planar contour).

## Allowable Subject Matter

3. The following is a statement of reasons for the indication of allowable subject matter:

While the entire scope of "acceptor centers" is not yet clear in view of the pending rejection under 35 USC 112, the prior art does not disclose an expunged layer of material adapted for use in microcircuits wherein the layer has a generally <u>non-planar contour</u> surface defined by residually detectable "acceptor centers" wherein the "acceptor centers" at least include Group III elements implanted in silicon.

Art Unit: 2829

#### Conclusion

Page 6

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. US 6,352,909 is cited for referring to Goesele et al.'s invention as a "slight improvement" to the prior art [col. 1, lines 45-48].

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Evan Pert whose telephone number is 703-306-5689. The examiner can normally be reached on M-F (7:30AM-3:30 PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kamand Cuneo can be reached on 703-308-1233.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 308-0956.
